

JOINT PAIN?

Did your doctor diagnose a cartila

- Cartilage performs important functions in our joints. But unlike our bones, once damaged, it cannot regenerate itself. An accident or a degenerative process such as osteoarthritis may lead to cartilage injuries, defects or deterioration. The results are pain and loss of function. In these cases treatment is necessary to stop the damage worsening and to prevent consequences, such as the need for artificial joint replacement.

It is therefore essential to intervene at an early stage!

Cartilage injury, defect or deterioration?

- chondrotissue® helps to repair joint cartilage and to restore the damaged tissue. Many people suffering from cartilage injuries have already benefited from chondrotissue® and have fully regained their joint function.

- chondrotissue® is a biological implant which is used to cover the cartilage defect through surgery and lets your cartilage grow anew. This membrane dissolves within a few months and it is completely replaced by your own new cartilage tissue.

**Do not wait longer,
ask your doctor for further information!**

More details are also available at www.biotissue.ch

chondrotissue® is a CE marked medical device which meets the high European medical standards. It results from years of scientific research and is certified by successful clinical outcomes. chondrotissue® is a product of BioTissue AG, the Swiss leader in tissue regeneration for over 10 years.
